

Proposed score and alarm drift across analysis blocks
Log-Euclidean detector; fault n = 48 records/block, held-out health n = 4 records/block. Lines show medians; bands show interquartile ranges.

(a) Threshold-normalized anomaly score

(b) Empirical block alarm rate

Block is an ordered operating point, not an independent repeat: median speed rises from ≈ 218 to 2,214 rpm. Score and alarm drift are therefore confounded with speed.
